Problem definition

NO₂ (ug m⁻³) Max h
Base case; Madrid

NO₂ hourly concentration. Plaza de España station (traffic)NO₂ hourly concentration. Plaza del Carmen station (background)

Soret et al. (2014)

Objective and research questions

Main objective:

- To estimate NO₂ concentrations at street level in Barcelona using a combination of CALIOPE-AQFS with a street scale air quality model.

Research questions:

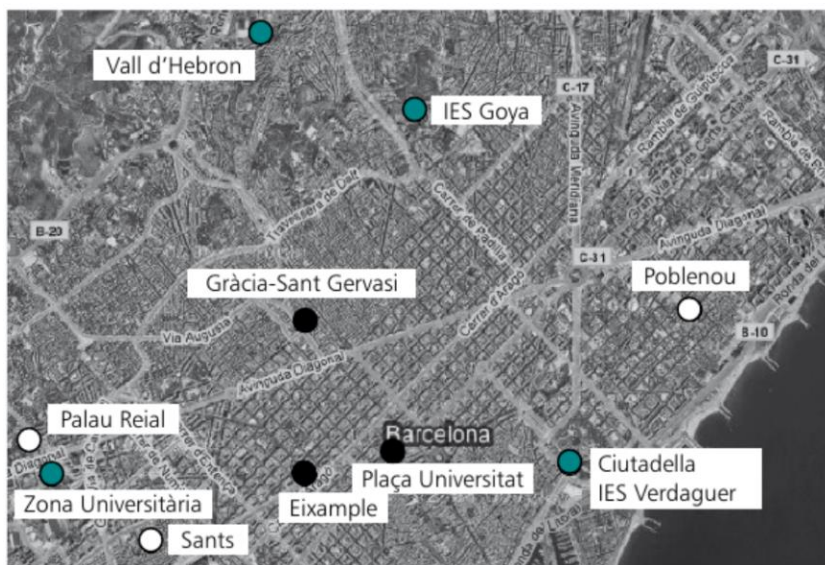

1. What street scale model should be used to estimate NO₂ concentrations at street level over Barcelona?
2. How should the street scale model be combined with CALIOPE-AQFS?
3. How accurate are output concentrations given by the developed system compared to CALIOPE-AQFS and monitoring station observations?

Methodologies

Scarce data for evaluation of the model

10 AQ monitoring stations available,
3 of them intense traffic stations
and only 3 meteorological stations

- Background stations
- Moderated traffic stations
- Intense traffic stations

Exposure of general population and
occurrence of higher concentrations

Not well represented

Duyzer et al. (2015)

Experimental campaign in April 2013

- Meteorological and air quality measures. Amato et al. (2014)
- April 2013 presents a 7-day air pollution episode

What street scale model?

R-LINE

(Snyder et al., 2013)

Gaussian plume

OSPM

(Berkowicz et al., 1997)

Street canyon

+

Line source dispersion
and chemistry

+

Access to source code

-

+

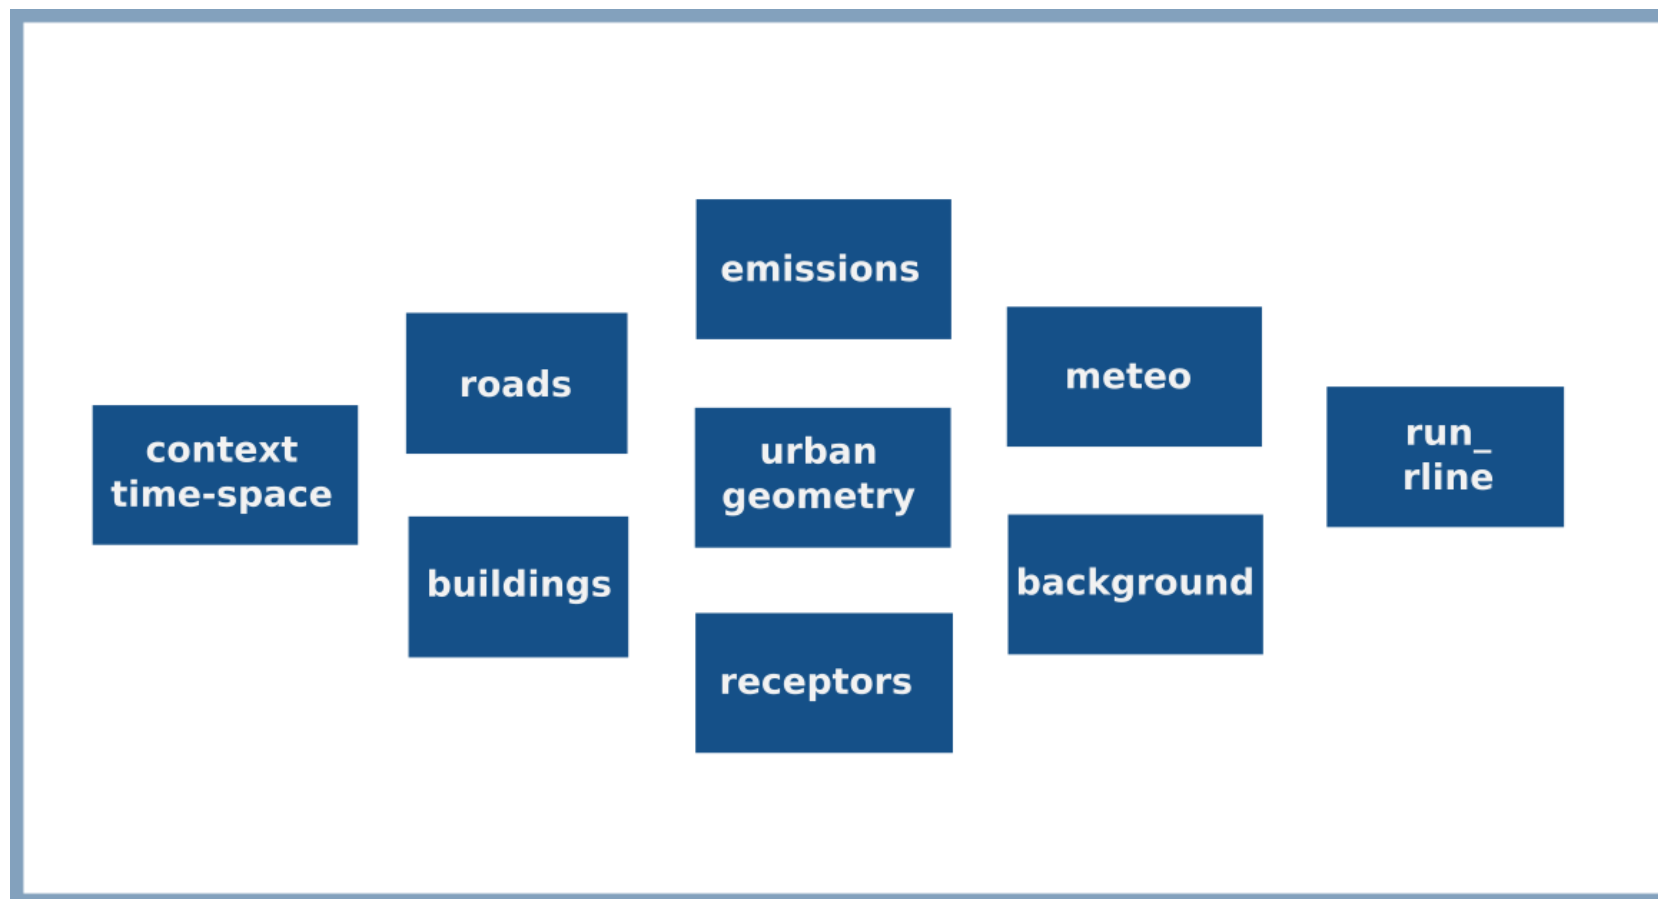

Applied to whole cities

+

+

Combined with
mesoscale AQMS

+

Estimate building height to street width ratio, mean building height...

3 options

Along building facades
any distance in between

At any distance from building
facades

Specific coordinates

Emissions: HERMES model

Bottom-up emission model for Spain (resolution: 1x1 km² x1h)

Baldasano et al. (2008); Guevara et al. (2013)

Road transport, emission estimation:

- COPERT → Exhaust emissions (hot&cold), evaporative emissions, tyre/break/road wear
- Resuspension (Pay et al., 2010)
- Updated for years 2011, 2012, 2013 and 2014

R-LINE world view

open terrain, one
meteorological input

Barcelona reality

complex terrain, each street
specific meteorological patterns

Adapt WRF wind to street level using RLINE (Snyder et al. 2013) local meteorology extension for each street segment:

- Estimates local meteorological parameters (z_0 and d_h) using street geometry
- Re-calculates atmospheric stability parameters (u_{star} and Monin-Obukhov length)
- Adjust meteorology to obtain wind conditions

Spatially averaged velocity over street is function of $\cos(\theta)$. Soulhac et al. (2008)

Background contributions: Triangle method

BSC-ES/AQF WRFv3.5.1+CMAQv5.0.2+HERMESv2 Nitrogen Dioxide ($\mu\text{g}/\text{m}^3$)
00h forecast for 00UTC 01 Nov 2015 - Catalonia Domain Res: 1x1km

High spatial ($1 \times 1 \text{ km}^2$) and
temporal resolution (1h)
over Barcelona

Select concentrations from
CMAQ depending on the wind
speed and direction provided
by WRF.

Results

1-11

12-18

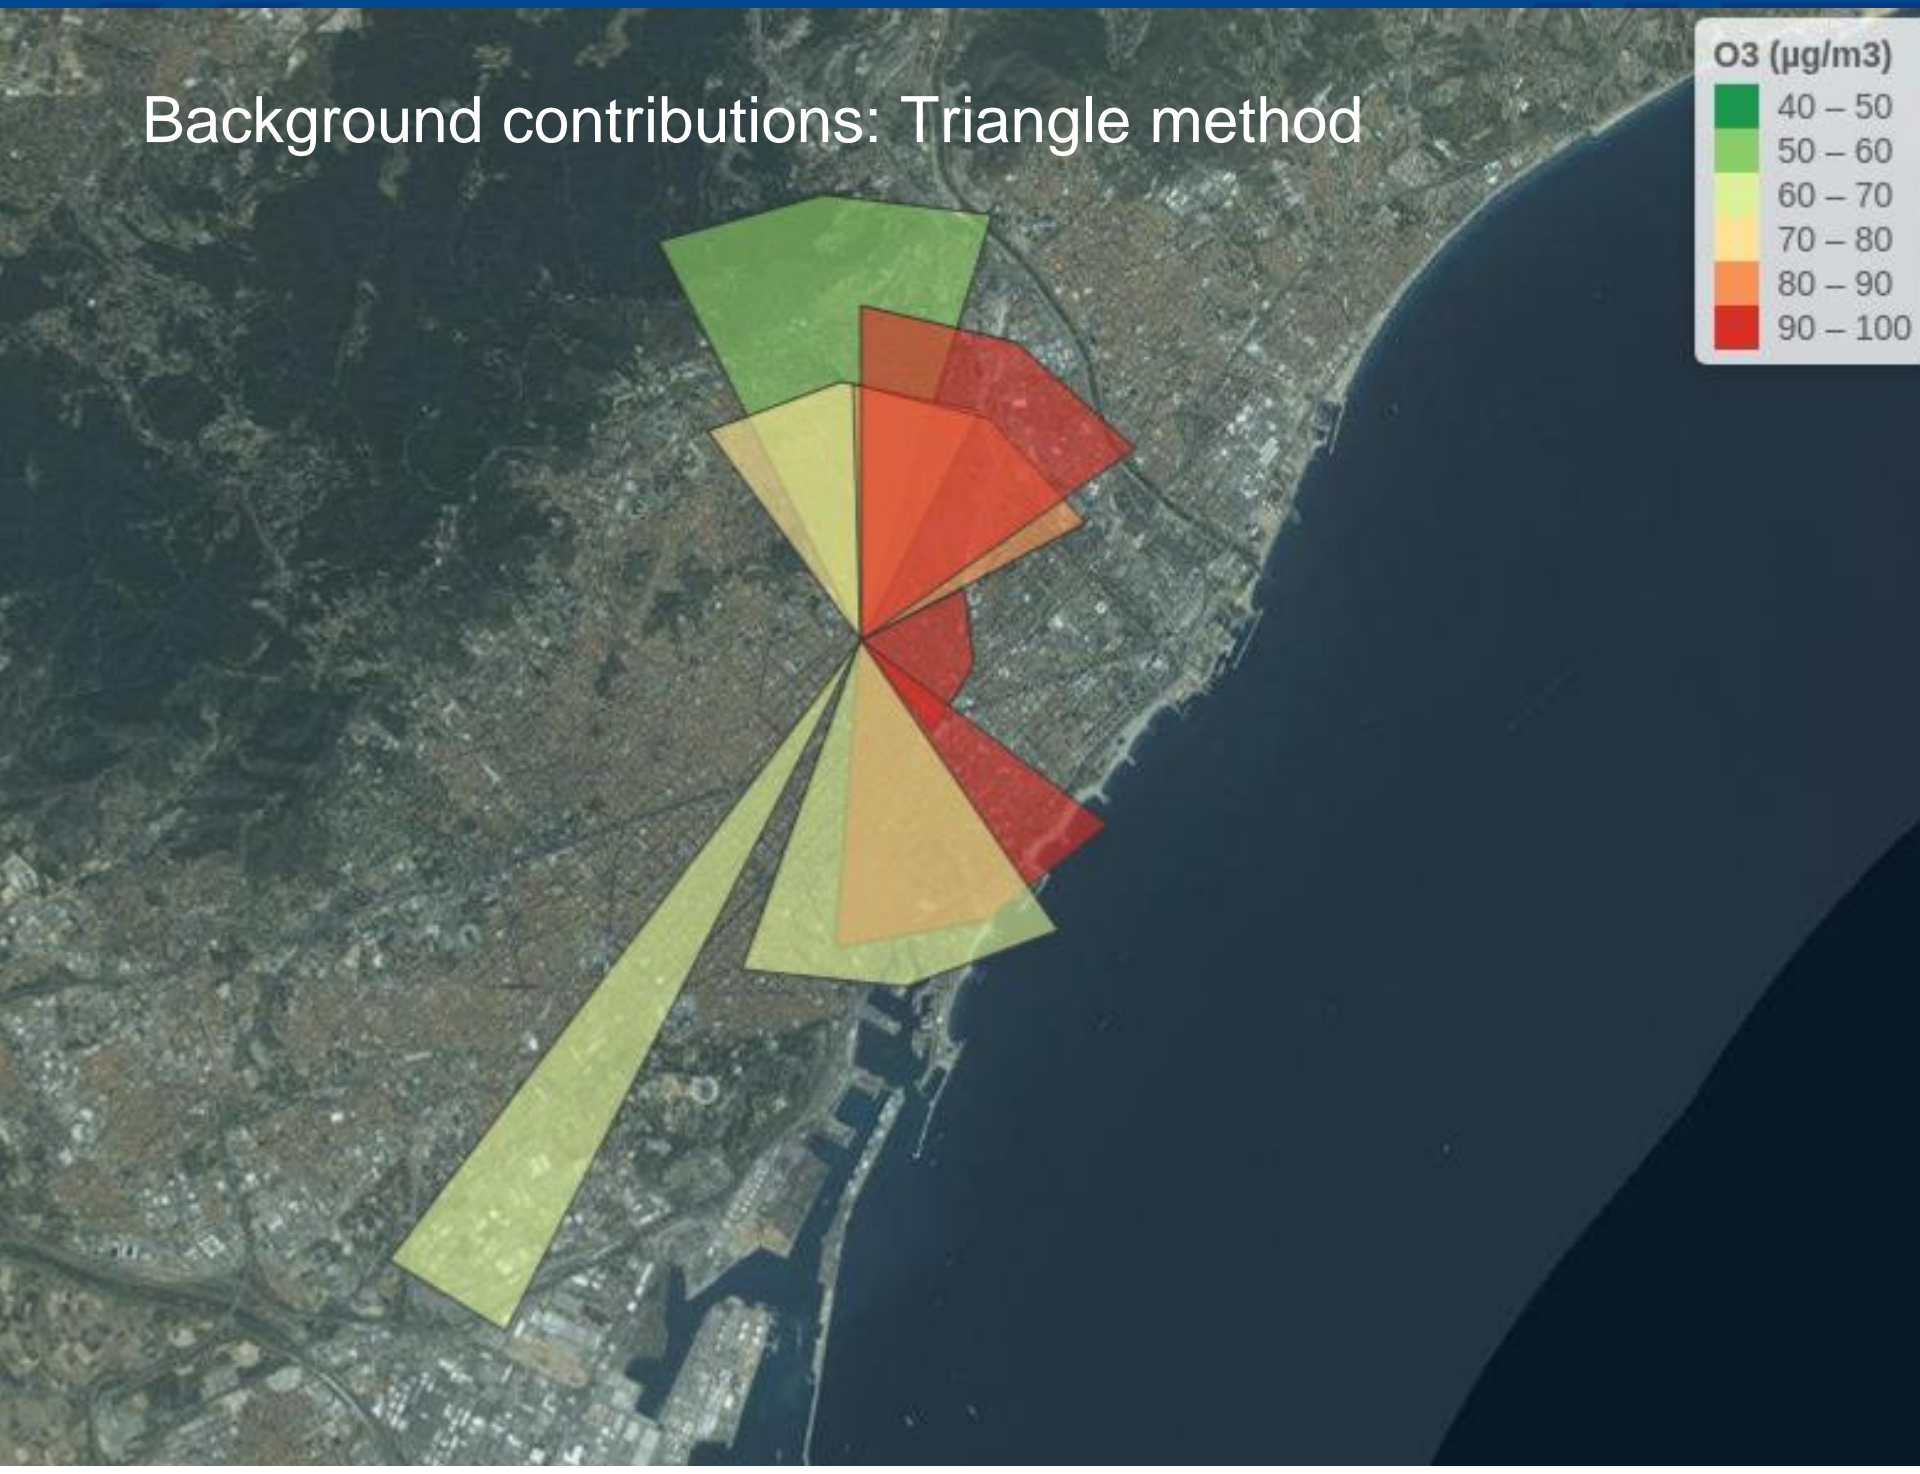

19-30

Meteorology: Wind channelled vs open terrain

Industria 309 - average wind speed per time of the day (03/04/2013 to 30/04/2013)

Background contributions: Triangle method

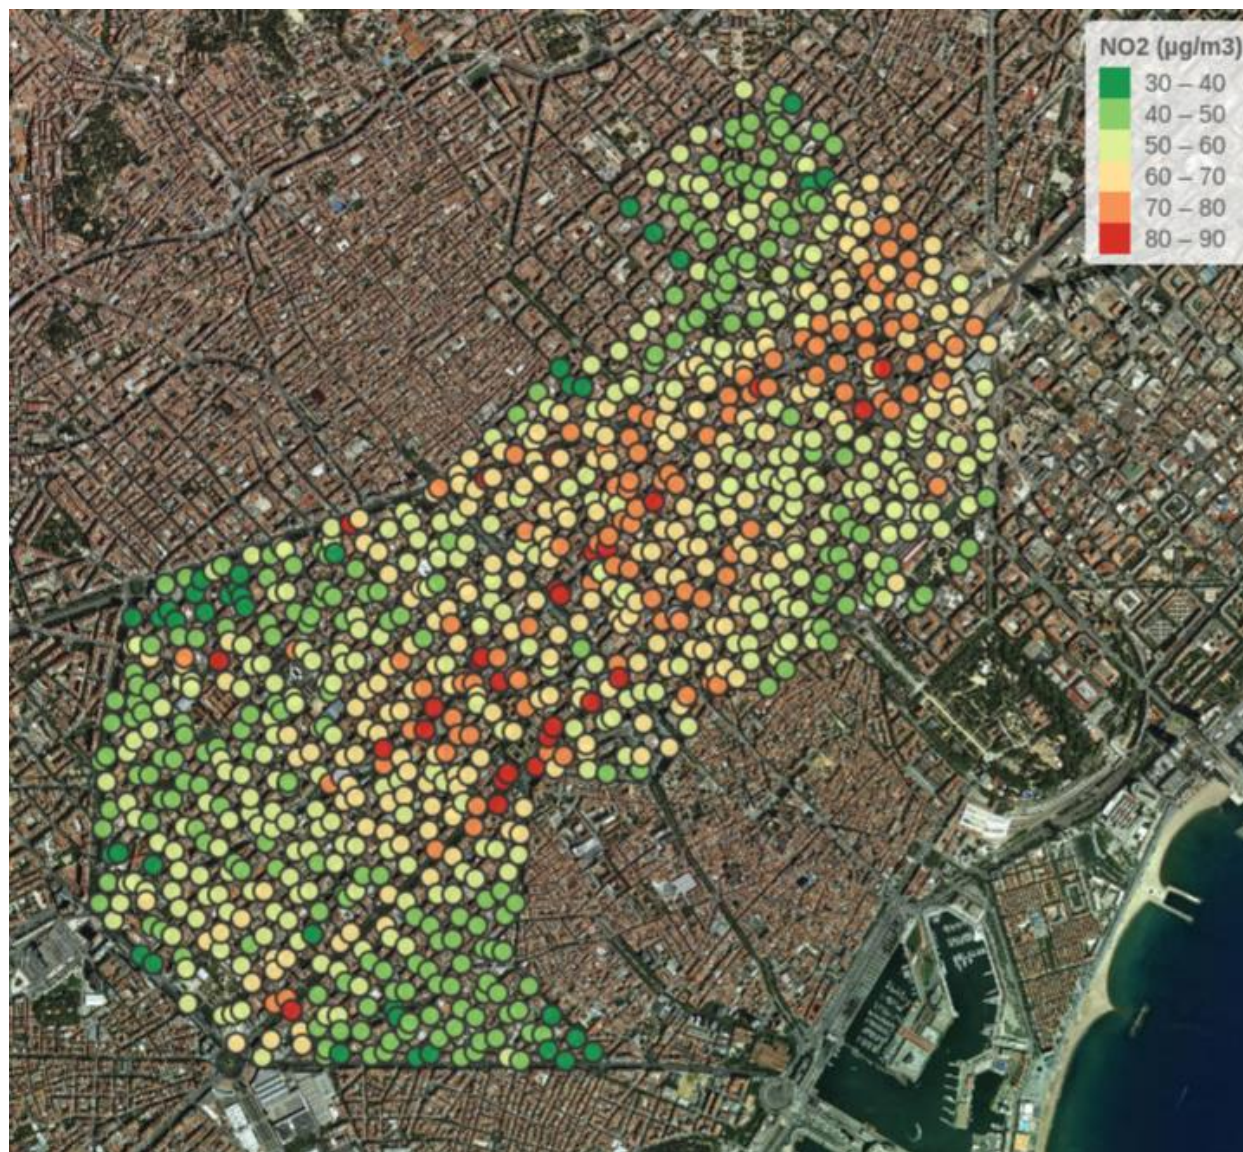

Background model compared to Ciutadella site observations from 12/4/2013 to 18/4/2013

Background model compared to Ciutadella site observations from 12/4/2013 to 18/4/2013

Period: April 2013

Industria road 213 site

R-LINE configuration:

- local meteorology
- triangle background
- all emission sources in context
- executed over 1 km²

	group	MB	RMSE	r
1	rline	-5.98	34.94	0.47
2	cmaq	-24.79	39.39	0.45

1	rline	0.20	29.21	0.55
2	cmaq	-9.69	30.08	0.54

Valencia road 445 site

	group	MB	RMSE	r
1	rline	14.97	42.30	0.43
2	cmaq	-25.53	40.34	0.48

Model comparison at Industria 213 from 4/4/2013 to 30/4/2013

Model comparison at Industria 213 from 12/4/2013 to 18/4/2013

Conclusions

Meteorology

- R-LINE extended to consider buildings when estimating street meteorological parameters

Background concentrations

- Triangle method developed to couple CMAQ with R-LINE:
 - Avoids double-counting emissions
 - Uses directly CMAQ outputs as input without re-executing CMAQ

CALIOPE-Urban

- Reproduces well diurnal pattern
- Morning and evening peaks well estimated in general but some days concentration too high
- Slightly improves CMAQ results in experimental campaign sites and provides a more detailed spatial pattern

Application: Political measure evaluation
